never seen with any other malimbe.

The flight is weak and rather jerky, and birds often call in flight.

The voice is rather like that of rubricollis, and thus very different from that of nitens or of soutatus (I do not know the voice of the much less common malimbicus). The most characteristic phrase may be written "choop-eee-wurr" followed by a characteristic weaver wheeze, the whole repeated at intervals. This call is made by the male near the nest.

Breeding

Some data on breeding were obtained in Ibadan in the rainy season of 1962. The nest is of the "inverted-sock type", made largely of strands from leaves of oil-palms. Two adjacent nests were constructed in June, the first utilised right away for a first brood and the second, completed by the male while the female was incubating in the first, but not used till October. Both broods, thought to be 6/2, were successfully fledged. The nests were in the lowest branch of a large Albizia tree at about 30ft from the ground. It was unlikely to be accidental that a wasp nest (Belonogaster) was not more than 3ft away. The nests were impossible to approach and it was thought that some general breeding data, such as quoted here, would be of more value at this stage than an account of the eggs, which could only have been obtained by lopping down the suspending branch of the tree.

It is greatly to be hoped that members of N.O.S. stationed in the southern regions of Nigeria will keep a sharp look out for this species. Any new information will be gratefully received (and acknowledge in any subsequent publication) by the writer.

PROVISIONAL CHECK-LIST OF THE BIRDS OF PLATEAU PROVINCE

OVER 3,000 FEET

D. Ebbutt, M.T.Horwood, R.E.Sharland & V.W.Smith *

This check-list covers the area over 3,000 ft. and not the whole of Plateau Province for two reasons; two of us (D.E. and V.W.S.) have very limited knowledge of the Lowlands division below 3,000 ft., and the area above 3,000 ft. offers an unusual ecological zone. Grassland and rocky hills predominate, there is a considerable amount of permanent water (mainly dams) and the orchard bush (which at one time covered most of the Plateau) is now mainly restricted to fringes along the escarpment.

The wet season extends mainly from April to September (with storms in some years from mid-March to early November). The

* Final draft not seen by M.T.H.

mean maximum temperature is about 80° F., and the mean minimum temperature about 60° F.

Column 1. Status

a = abundant w = widespread
 f = frequent l = local
 o = occasional
 r = rare
 acc = accidental
 x = bird identified in the hand

 WS = wet season only
 DS = dry season only
 WV = Palaearctic migrant
 P = passage migrant, i.e. birds passing through during restricted periods.
 R = resident. (This category has been omitted in most cases; where no seasonal classification is given, the species is most probably resident).
 ? queries status or seasonal distribution, not identification.

Column 2. Remarks.

Note : The number before each species denotes its page in the 2 vol. Bannerman (1954).
